

FnP Sales Analysis Dashboard

1. Project Overview

This project analyses sales data for a gifting business using Excel. The aim was to understand sales performance, customer purchasing patterns, popular products and occasions, and delivery performance.

I used Power Query for data cleaning and transformation, PivotTables for analysis, and PivotCharts and slicers to build an interactive dashboard.

2. Data Cleaning and Preparation

I used Power Query to prepare the data for analysis.

- Checked for null values, extra spaces, inconsistent capitalisation and other data inconsistencies.
- Checked and corrected data types.
- Merged the product and order tables using product_id to bring product pricing into the order data.
- Created a revenue column using quantity multiplied by price.
- Extracted months from order dates for monthly analysis.
- Calculated delivery time using order and delivery dates.
- Created a customer classification to identify new and repeat customers.

3. Data Modelling and Analysis

After preparing the data, I loaded it into Excel and established relationships between the tables using their keys.

I then used PivotTables to summarise the data and analyse sales performance across different dimensions, including time, product category, occasion, city and customer.

4. Dashboard Development

I created an interactive Excel dashboard using PivotCharts, KPI cards and slicers. The dashboard covers the following metrics and analysis:

Key performance indicators

- Total orders
- Total revenue
- Average order value
- Average delivery time
- Total quantity sold, where relevant

Sales analysis

- Revenue by occasion
- Revenue by product category
- Monthly revenue
- Top five products by revenue
- Top ten cities by order volume
- Orders by hour of the day

The dashboard provides an overview of business performance and allows users to explore sales patterns through interactive filters.

5. Key Insights

- **Overall sales performance**
The business recorded 1,000 orders and generated approximately ₹35.2 lakh in revenue, with an average delivery time of 5.5 days.
- **Seasonal revenue patterns**
February and August were the strongest months, each generating approximately ₹7 lakh or more in revenue. This suggests that sales vary across the year.
- **Revenue by occasion**
Anniversary was the highest-revenue occasion, generating approximately ₹6.76 lakh, followed by Raksha Bandhan at ₹6.32 lakh and Holi at ₹5.75 lakh.
- **Revenue by product category**
Colors was the leading category, contributing 28.56% of total revenue. Soft Toys and Sweets followed, contributing 21.04% and 20.84%, respectively.
- **Best-performing products and ordering patterns**
Magnum Set was the highest-revenue product, generating approximately ₹1.22 lakh. The dashboard also showed that orders peaked in the evening, with the highest volume around 7 PM at approximately 53 orders.

6. Business Recommendations

- **Plan for seasonal demand**
Prepare inventory and marketing campaigns ahead of peak months such as February and August to make better use of seasonal demand.
- **Focus on key gifting occasions**
Prioritise campaigns around Anniversary and Raksha Bandhan, using occasion-specific offers and gift bundles.
- **Build on strong product categories**
Use Colors, Soft Toys and Sweets in targeted promotions and cross-selling activities, while reviewing the performance of other categories for potential improvement.

- **Promote high-revenue products**

Feature products such as Magnum Set, Quia Gift and Dolores Gift in relevant campaigns and product bundles.

- **Plan evening operations**

Review staffing and order-processing capacity during peak ordering hours. Monitor delivery performance to identify opportunities to improve the average delivery time.

7. Conclusion

This project helped me use Excel to move from raw sales data to an interactive dashboard and business-focused findings. It brought together data preparation, data modelling, PivotTable analysis and visualisation to explore sales performance and identify opportunities for better planning and decision-making.
